

SUMMARY NICANOR

LOCATION AND ACCESS

The Nicanor project is located in the III Region of Atacama, Northern Chile, approximately 1 hour drive northwest from the city of Vallenar and near to the mine Los Colorados (CMP), Astillas (AMSA) and various exploration drilling projects.

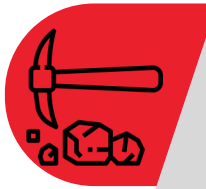

01

GEOCHEMICAL AND GEOPHYSICAL

A geochemical anomaly was confirmed with approximately 300 samples suggesting the possibility of IOCG deposit. The magnetic anomaly was confirmed with presence of magnetite, mushketovite and hematite in the area of the survey.

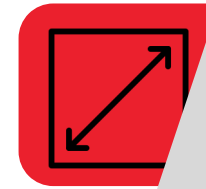

04

MINING PROPERTY

100% privately owned by COSEMÍN Ltda. The Nicanor mining tenements cover 3.501 hectares, including 13 exploitation concessions and 4 exploration concessions.

02

TARGET SIZE

Unkown. However, we hold to the hypothesis of a medium-large size mineral resource, according to the extension of the anomalies and the NW feeder structures of the system.

05

ROCK CHIP AND MINERALIZATION

Iron Oxide Copper and Gold, type deposit with cobalt and REE credits (IOCG + Co + REE), hosted in La Negra Formation, the most important geological unit of the northern Chile Coastal cordillera with numerous copper deposits.

03

DRILLING

Next steps consider additional magnetometry and IP-Resistivity in the main target areas to define a preliminary drilling program.
